

DOE Sequestration Programs The World's Most Ambitious

A panel of scientific experts from the International Energy Agency has validated that the US Department of Energy Regional Carbon Sequestration Partnerships and their large-scale carbon dioxide tests are the world's most ambitious and will significantly advance carbon capture and storage in the United States, Canada and internationally, according to DOE. "The IEA found that the seven Regional Carbon Sequestration Partnerships are unique in that no other country or region has initiated such an ambitious CCS effort. The panel's findings are important since the Partnerships, comprised of 41 US states and four Canadian provinces, have entered the stage (Phase Three) where they are focusing on large-scale tests involving a million tons or more of carbon dioxide injected annually," says DOE. The panel of scientific experts selected by the IEA from Europe, Canada and Australia determined that the RCSP's Phase Three-Deployment is "an excellent program that will significantly advance and accelerate the field of CCS", cites DOE.
